

What is VegaBit Guardian?

VegaBit Guardian offers faster, more secure authentication through continuous authentication and automatic proximity locking. It manages passwords, controls computer access groups, audits logins (even for shared accounts), and auto-locks all workstations.

Key Features

- 2FA Solution: Enforce two-factor authentication across your network.
- Password Manager: Securely manage and store passwords.
- Audit System: Track who logged into which computer.
- Proximity Lock: Automatically lock workstations based on user proximity.

Password Security

Passwords are stored on the user's computer with AES-256 encryption, ensuring they are never transmitted over the air and are protected from spoof attacks.

Multi-Computer Locking

Guardian can lock and log onto any number of computers without memory limits or latency issues, as passwords are not stored on the key fob.

HIPAA Compliance

VegaBit Guardian supports automated HIPAA compliance by protecting patient records and health information through robust authentication and auditing.
